

LAUNCH - MVPS & PRODUCT PROTOTYPES

The first version does not have to deliver a roadmap. It has to prove the riskiest assumption.

A focused MVP puts real users, demos or investors into the core workflow - before budget flows into untested features.

WHERE VALUE IS LOST TODAY

01 Too much before validation

Months of development produce scope, but no insight from real use yet.

02 Runway flows into assumptions

Every build month spent on unused features makes the wrong bet more expensive.

03 Pitch instead of product

Investors and pilot customers can rate slides - or test a real workflow.

THE GOAL

A live product with usage data, a stable demo environment and a codebase that can keep growing once demand is confirmed.

FROM BOTTLENECK TO PRODUCTIVE SYSTEM

The idea is cut down to one core hypothesis.
Only what makes user behavior and feasibility testable gets built - with short deployments and a production-ready base.

SCOPE INSTEAD OF FEATURE LIST

3-5 weeks for the typical MVP sprint

Scope is bounded by one question: does this feature produce solid learning about users and the core hypothesis?

WHAT THE BUILD DELIVERS

01

Product scoping and prioritization

02

UI/UX and core workflow

03

Authentication and data model

04

Basic analytics and monitoring

05

CI/CD and production deployment

THREE ROUTES - ONE DECISIVE DIFFERENCE

NO-CODE PROTOTYPE

Good for screens, limited on real product logic.

FULL BUILD

High upfront investment on untested assumptions.

WEBVISE MVP

Direct product and engineering ownership of the smallest production test.

The MVP scope holds when learning goal, technical base and product ownership fit together.

THE THREE QUESTIONS BEFORE A GOOD DECISION

01

What really belongs in the MVP?

Typically authentication, the core flow, database, deployment and basic analytics. Everything else waits for insight from real use.

02

Will the first version have to be rebuilt later?

The codebase is built to grow: TypeScript, data model, CI/CD and monitoring form an extendable product base. Whether individual components are adjusted later depends on usage and scale.

03

Is product strategy part of the project?

Yes. Feature cut and prioritization belong to scoping; the focus stays on fast, production-ready delivery.

NEXT SENSIBLE STEP

30 minutes. One workflow. A solid build plan.

In a scoping session we define core hypothesis, users, proof of success and the smallest production workflow. That becomes the MVP plan.
