

OPERATE - CLIENT PORTALS & BUSINESS APPLICATIONS

Customers should see status, files and next steps without having to ask your team.

A secure portal joins the user experience and internal processing - with login, roles, forms, files, status and a backend you control.

WHERE VALUE IS LOST TODAY

- 01 Status questions land in the inbox**
Customers ask about progress, documents and next steps.
- 02 Files switch channel**
Uploads, approvals and versions scatter across email and folders.
- 03 Frontend and operations are separate**
The customer sees little; internally there is no shared view of the case.

THE GOAL

Customers, members or partners get one clear place for tasks, information, files and progress - the team keeps control in the backend.

FROM BOTTLENECK TO PRODUCTIVE SYSTEM

User groups, visibility, editing rights and internal administration are settled first. The portal is built as a user product and an operations tool at once.

PUBLIC CLIENT CASE

OHYP: application, PDF certificates and admin dashboard in 6 weeks

A 10-step form, automatic certificates and internal processing run in one end-to-end system.

WHAT THE BUILD DELIVERS

01

Login and account management

02

Role-based navigation

03

Forms, uploads and review status

04

Admin dashboard and workflow history

05

Notifications and system integrations

THREE ROUTES - ONE DECISIVE DIFFERENCE

EMAIL AND FOLDERS

Familiar, but without status, roles and a reliable history.

PORTAL KIT

Fast, as long as workflow and permissions fit the template.

WEBVISE

Direct ownership of customer experience, permissions and operations backend.

A portal holds up when roles, status, files and existing systems are planned together.

THE THREE QUESTIONS BEFORE A GOOD DECISION

01

Can different user roles be represented?

Yes. View, submit, edit, approve and admin rights are modeled per user group.

02

Are uploads and status tracking possible?

Yes. Files, timelines, notifications, review status and admin views can be part of the same system.

03

Does this fit our CRM or backend?

Yes. The portal is planned around existing CRM, payment, database, email and API systems.

NEXT SENSIBLE STEP

30 minutes. One workflow. A solid build plan.

In discovery we define user groups, the core case, permissions, status model and existing systems. After that a phased delivery plan is in place.
