

OPERATE - CUSTOM BUSINESS APPLICATIONS

When standard software bends the process, custom software turns from a cost item into an operating advantage.

webvise builds operational applications for workflows that do not fit cleanly into a dashboard, portal, booking system or no-code stack.

WHERE VALUE IS LOST TODAY

- 01 The stack does not grow with you**
Load, data volume and integrations overwhelm an architecture that was enough at the start.
- 02 Decisions last for years**
Data model, security and deployment set maintainability and speed.
- 03 The workflow fits no template**
Staff work around standard software with spreadsheets, copy and paste and side routes.

THE GOAL

A production-ready, observable application with documented core routines, tests for the agreed risks and a codebase that can be extended.

FROM BOTTLENECK TO PRODUCTIVE SYSTEM

Architecture before features: data model, API contracts and deployment strategy are settled before the build. Then the application grows step by step and stays type-safe throughout.

PUBLIC FULL-STACK CASE

OHYP: from application to internal processing in 6 weeks

A 10-step form, automatic PDF certificates and an admin dashboard connect public and operational logic.

[OPEN THE SOURCE](#)

WHAT THE BUILD DELIVERS

01

Data model and API architecture

02

Authentication and authorization

03

Frontend, backend and integrations

04

CI/CD, staging and monitoring

05

Documentation and source code ownership

THREE ROUTES - ONE DECISIVE DIFFERENCE

NO-CODE STACK

Good to start with, fragile on complex logic and error handling.

SEVERAL SPECIALIST TOOLS

Each tool works, handovers and data model stay scattered.

WEBVISE

Direct senior ownership of architecture, build, operation and source code handover.

A business application stays workable when architecture, operation and integrations are settled before features.

THE THREE QUESTIONS BEFORE A GOOD DECISION

01

Which tech stack is used?

Typically Next.js and React, PostgreSQL, type-safe APIs, modern authentication plus Sentry and PostHog for operation and usage.

02

Are hosting and DevOps included?

Yes. CI/CD, staging, monitoring and alerting are set up; the production environment is part of the handover.

03

Can existing systems be connected?

Yes. Typical are payment, email, CRM, ERP and internal APIs. The actual integration effort is planned before the build.

NEXT SENSIBLE STEP

30 minutes. One workflow. A solid build plan.

Discovery settles users, data model, core routines, integrations, load and risks. That becomes a phased architecture and delivery plan.
