

AUTOMATE - AI AUDIT & CONSULTING

Before AI scales, one real workflow has to show whether it can automate steps reliably.

An engineering audit joins process mapping, realistic test cases and a working prototype with a clear build or no-build decision.

WHERE VALUE IS LOST TODAY

01 Strategy stays too abstract

A slide describes the potential, but not yet a routine you can rely on.

02 Exceptions decide

Unstructured data, edge cases and approvals break the perfect demo path.

03 The route into production is missing

Tool lists do not answer how data, reviews, fallbacks and ownership fit together.

THE GOAL

Your team gets a prototype you can check, a clear recommendation and the production plan for the smallest automation that pays off.

FROM BOTTLENECK TO PRODUCTIVE SYSTEM

One frequently run, time-heavy and checkable workflow gets mapped. Then a small prototype tests real inputs, exceptions and human review points.

TECHNICAL CREDIBILITY

OpenAI Select Partner

Partner status does not replace a use-case check. It backs an approach that judges models, data and reviews against the real workflow.

[OPEN THE SOURCE](#)

WHAT THE BUILD DELIVERS

01

Workflow and process map

02

Data, privacy and review requirements

03

Working prototype

04

Realistic test cases and risk notes

05

Production plan with cost drivers

THREE ROUTES - ONE DECISIVE DIFFERENCE

STRATEGY WORKSHOP

Creates direction, often leaves technical feasibility open.

STRAIGHT TO A LARGE BUILD

High investment before data and edge cases are tested.

WEBVISE AUDIT

Direct engineering ownership of a real prototype, evaluation and production plan.

An AI project holds up when prototype, delivery ownership and the route into production fit together.

THE THREE QUESTIONS BEFORE A GOOD DECISION

01

What exactly is in the prototype?

Process mapping, data and review requirements, a bounded working prototype, realistic test cases and a production plan.

02

Is this consulting or delivery?

Both - deliberately small. The recommendation is tied to a working test of your real workflow.

03

Does webvise build the production version afterwards too?

Yes, if the prototype shows value. Then monitoring, fallbacks, permissions and clear operation follow.

NEXT SENSIBLE STEP

30 minutes. One workflow. A solid build plan.

We pick a recurring workflow and check volume, data, cost of errors, exceptions and review points. That sets the audit and prototype scope.
