

AUTOMATE - AI AGENTS WITH REVIEW GATES

Agents become business-ready when freedom, risk and human approval are clearly separated.

Agents with tool access take on bounded tasks; queues, confidence, monitoring and review gates keep critical decisions with people.

WHERE VALUE IS LOST TODAY

- 01 Unstructured inputs take time**
Documents, requests and messages have to be read, sorted and transferred.
- 02 Routing waits for people**
Support tickets, leads or cases sit until someone sets priority and target system.
- 03 Autonomy creates new risk**
Without approvals, logs and fallbacks, speed cannot be justified.

THE GOAL

A faster, consistent workflow without black-box accountability: AI takes the recurring work, people keep the decisions.

FROM BOTTLENECK TO PRODUCTIVE SYSTEM

First we separate what AI may draft, classify, extract or suggest - and what a human has to approve. Then the review loop, tools and running operation are built.

CONTROLLED AGENT SYSTEMS

OpenAI Select Partner

The technical platform is only one part. What decides it is bounded tasks, tool calls you can check, human approvals and a measurable business effect.

[OPEN THE SOURCE](#)

WHAT THE BUILD DELIVERS

01

Input capture and structured outputs

02

Prompt, model and tool orchestration

03

Review queue with approval and escalation

04

Confidence, evaluation and error handling

05

Analytics for throughput and overrides

THREE ROUTES - ONE DECISIVE DIFFERENCE

FULLY AUTONOMOUS

Maximum speed, but needless risk on critical decisions.

ASSISTANT ONLY

Helps with drafts, but stays outside the operational routine.

WEBVISE

Direct ownership of the bounded agent task, review gates, logs and fallbacks.

An agent becomes business-ready when autonomy, data access and human approval are clearly bounded.

THE THREE QUESTIONS BEFORE A GOOD DECISION

01

Does webvise build fully autonomous agents?

Only when the risk profile allows it. Most business workflows hold up better with human approval.

02

Can internal knowledge sources be used?

Yes. Retrieval-based workflows can build on approved sources and clear permissions.

03

How do we avoid AI gimmicks?

Every project starts at the workflow and the business outcome. Without a measurable gain in speed, quality, consistency or cost, AI does not belong at the center.

NEXT SENSIBLE STEP

30 minutes. One workflow. A solid build plan.

We pick a clearly bounded task and define allowed actions, data access, confidence, review gates and escalation. That becomes the production plan.
