

## AUTOMATE - COMPANY BRAIN SYSTEMS

# Knowledge only becomes a system when source, validity and access right stay attached to the answer.

A company brain makes documents, decisions, rules and context reusable - with permissions, review and visible uncertainty.

## WHERE VALUE IS LOST TODAY

**01** Answers depend on people

The team asks the same experts again and again because the current source is hard to find.

**02** Decisions disappear

Context stays in chats and meetings, cut off from documents and from what follows later.

**03** AI answers cannot be checked

Without sources, permissions and freshness, no one can stand behind an answer.

## THE GOAL

A maintained operational memory that ties current answers to sources and makes gaps or uncertainty visible.

## FROM BOTTLENECK TO PRODUCTIVE SYSTEM

Sources, trust boundaries, edit rights and the decisions being supported are settled first. Then memory model, retrieval, review process and interface are built.

## OPERATING MODEL INSTEAD OF CHAT DEMO

Answer quality comes from maintained sources and reviews

OpenAI Select Partner status backs clear source boundaries, permissions and evaluation instead of uncontrolled document chat.

## OPEN THE SOURCE

## WHAT THE BUILD DELIVERS

01

Source inventory and permission model

02

Import, cleanup and metadata

03

Search and retrieval interface

04

Review, approval and staleness handling

05

Citations, fallbacks and quality monitoring

## THREE ROUTES - ONE DECISIVE DIFFERENCE

## FOLDER SEARCH

Finds files, but rarely connects decision, context and validity.

## CHATBOT OVER DOCUMENTS

A fast interface, but unreliable quickly without a review and operating model.

## WEBVISE

Direct ownership of source structure, retrieval, rights, review and monitoring.

# A company brain is only as solid as its sources, permissions and its running review process.

## THE THREE QUESTIONS BEFORE A GOOD DECISION

01

**Is this just a chatbot over documents?**

No. Source structure, permissions, review workflows, retrieval evaluation and the operating model are central; the assistant is only an interface.

02

**Can private or role-based content be protected?**

Yes. Source boundaries and permissions are modeled so users only retrieve knowledge they are cleared for.

03

**How does the knowledge stay current?**

Ownership, review status, flags on outdated content, update flows and gap analytics are built into how it runs.

## NEXT SENSIBLE STEP

**30 minutes. One workflow. A solid build plan.**

We pick a recurring decision or question and check sources, owners, permissions and freshness. That becomes the first knowledge workflow you can rely on.
