

AUTOMATE - AI WORKFLOW AUTOMATION

AI does not pay off as a feature. It pays off when the effort for a recurring step drops measurably.

Production automation joins real inputs, your systems, human reviews, monitoring and fallbacks - instead of stopping at a demo.

WHERE VALUE IS LOST TODAY

- 01 Repeat work takes hours every week**
Data entry, document checks, reporting and switching between systems repeat every day.
- 02 Data stays unused**
Documents and knowledge sit scattered, although they feed into decisions regularly.
- 03 No-code ends at the exception**
Conditional logic, error handling and missing connectors create new manual steps.

THE GOAL

A production workflow with monitoring, error handling and defined human interventions; the impact is checked after launch against real processing times.

FROM BOTTLENECK TO PRODUCTIVE SYSTEM

The routine with the most recurring friction gets modeled first. The automation joins inputs, models, tools and reviews with clear guardrails.

PUBLIC CLIENT CASE

MP Bau: bill of quantities to GAEB-D83 plus quantity take-off

Moving it by hand used to take about an hour per document. Today a protected workflow supports processing and checking.

WHAT THE BUILD DELIVERS

01

End-to-end workflow automation

02

Model, prompt and tool logic

03

Integrations and data pipelines

04

Review status, monitoring and alerting

05

Documentation and maintenance guide

THREE ROUTES - ONE DECISIVE DIFFERENCE

NO-CODE AUTOMATION

Good for linear routines with ready-made connectors.

SINGLE AI FEATURE

Produces output, but not yet a controlled business process.

WEBVISE

Direct ownership of workflow, integration, review, monitoring and operation.

ROI becomes solid when use case, data protection and measurement are settled before the production build.

THE THREE QUESTIONS BEFORE A GOOD DECISION

01

Which AI functions are realistic?

Typically document processing, classification, content tools, assistants and custom agents - always along a clear workflow.

02

How is data protection handled?

The data model is set in scoping: clear access rights, API models with no training on customer data and, where needed, private or on-premise processing.

03

When does a solid ROI show up?

That depends on volume, cost of errors, reviews and running costs. It is estimated before the build and checked after launch with real time data.

NEXT SENSIBLE STEP

30 minutes. One workflow. A solid build plan.

We quantify one recurring routine: volume, time, cost of errors, systems and the reviews it needs. That gives the first production automation scope.
